TI Development of hyperplasias, preneoplasias, and mammary tumors in
MMTV-c-erbB-2 and **MMTV-TGF.alpha.**
transgenic rats

SO Am. J. Pathol. (1999), 155(1), 303-314
CODEN: AJPA44; ISSN: 0002-9440

AU Davies, Barry R.; Platt-Higgins, Angela M.; Schmidt, Gunter; **Rudland,**
Philip S.

AB Human cDNAs corresponding to two epidermal growth factor-related products that are overexpressed in human breast cancers, that for **c-erbB-2** (HER-2) and for transforming growth factor **.alpha. (TGF.alpha.)**, have been cloned downstream of the mouse mammary tumor virus (**MMTV**) long terminal repeat promoter and injected into the pronucleus of fertilized oocytes of Sprague-Dawley rats to produce **transgenic** offspring. Expression of the **transgenic** mRNAs is not detectable in mammary tissue from virgin **transgenic** rats but is detected in mammary tissue from certain lines of mid-pregnant **transgenic** rats. When two such lines of either type of **transgenic** rat are subjected to repeated cycles of pregnancy and lactation, they produce, primarily in the mammary glands, extensive pathologies, whereas virgin **transgenic** rats produce no such abnormalities. Multiparous **transgenic** female offspring from **c-erbB-2**-expressing lines develop a variety of focal hyperplastic and benign lesions that resemble lesions commonly found in human breasts. These lesions include lobular and ductal hyperplasia, fibroadenoma, cystic expansions, and papillary adenomas. More malignant lesions, including ductal carcinoma in situ and carcinoma, also develop stochastically at low frequency. The mammary glands of **transgenic** females invariably fail to involute fully after lactation. Similar phenotypes are obsd. in female **MMTV-TGF.alpha. transgenic** rats. In addn., multiparous **TGF.alpha.-expressing** female **transgenics** frequently develop severe pregnancy-dependent lactating hyperplasias as well as residual lobules of hyperplastic secretory epithelium and genuine lactating adenomas after weaning. These **transgenic** rat models confirm the conclusions reached in **transgenic** mice that overexpression of the **c-erbB-2** and

TGF.alpha. genes predisposes the mammary gland to stochastic tumor development.

CODEN: BSSYAT; ISSN: 0067-8694

AU Davies, Barry R.; Warren, Joe R.; Schmidt, Gunter; **Rudland, Philip S.**

AB Although **transgenic** mouse models for breast cancer have frequently been reported in the literature, **transgenic** rat models have not been described. The authors have generated **transgenic** rats overexpressing the human transforming growth factor .alpha. (**TGF.alpha.**) and **c-erbB-2** genes in the mammary gland under the control of the mouse mammary tumor virus (**MMTV**) long terminal repeat promoter, and have analyzed multiple lines of these rats to the second (F2) generation. Female **MMTV/TGF.alpha.** rats frequently develop severe hyperplasias during pregnancy, and a variety of tumors of long latency. The mammary glands of **MMTV/TGF.alpha.** rats fail to involute fully after the completion of lactation. Expression of the **TGF.alpha.** transgene is highest in the hyperplasias. **MMTV/c-erbB-2** female rats develop a spectrum of benign and malignant lesions, including ductal carcinoma in situ and carcinomas. Expression of the **c-erbB-2** transgene is found in benign tumors such as fibroadenomas, but is highest in the carcinomas. These animals model a spectrum of lesions found in human breasts and suggest that **TGF.alpha.** overexpression can act at a relatively early stage in the pathogenesis of breast cancer in the rat, resulting in a predominantly hyperplastic response, whereas overexpression of **c-erbB-2** plays a role in the induction of various benign lesions and more advanced breast carcinomas.

AB Provided is a cell line derived from a transgenic animal comprising (1) a conditional oncogene, transforming gene or immortalizing gene or a cell cycle affecting gene; and (2) a cell type specific promoter. They include a neuronal cell line in which the cell type specific promoter is an **NF-L** gene promoter, and a mammary cell line in which the cell type specific promoter is a **MMTV** gene promoter. The conditional oncogene, transforming gene or immortalizing gene is preferably a SV40 tsA58 gene. Prodn. of transgenic Sprague Dawley rats by using mammary-targeting vector **MMTVLTRtsA58U19** (contg. **MMTV** Long Terminal Repeat) or brain-targeting vector **NF-LtsA58.delta.t** (contg. human neurofilament light chain promoter), and prepn. of cell lines B2LT1 and NF2C from the mammary of **MMTVLTRtsA58U19 transgenic rats** and the brain of **NF-LtsA58.delta.t transgenic rats**, resp., were shown. Prodn. of **transgenic rats** carrying oncogene such as **c-erb.beta.-2** or transforming growth factor .alpha. (**TGF.alpha.**) that are highly assocd. with breast cancer was also shown. The transgenic

animals and their immortalized cell lines are useful for toxicol. and pharmacol. studies.

TI Tissue-specific expression of rat light **neurofilament**
promoter-driven reporter gene in transgenic mice
SO Biochem. Biophys. Res. Commun. (1993), 192(2), 465-70
CODEN: BBRC9; ISSN: 0006-291X
AU Reeben, Mati; Halmekyto, Maria; Alhonen, Leena; Sinervirta, Riitta;
Saarma, Mart; Janne, Juhani
AB Nine transgenic mice lines carrying either 5 kbp or 407 bp of the 5'
flanking sequence of the rat light **neurofilament** gene linked to
the chloramphenicol acetyltransferase (CAT) structural gene were produced.
With the 5 kb light **neurofilament** 5' flanking region governing
the expression of CAT, reporter gene activity was detected not only in
brain but also in the eye lens and skeletal muscle, yet not in other
tissues. With the 407 bp construct, reporter gene activity was detected
only in the brain, although expression was approx. one tenth of that found
with the 5 kb 5' region. These results, together with earlier
observations, indicate that the sequence -407 to -292 of the proximal
promoter region for the light **neurofilament** gene or sequence +15
to +75 bp after the transcription initiation site is crucial for
brain-specific expression of a fusion gene in transgenic mice.

TI Isolation of a potential neural stem cell line from the internal capsule of an adult **transgenic rat** brain.

SO JOURNAL OF NEUROCHEMISTRY, (1999 Nov) 73 (5) 1859-70.

Journal code: JAV; 2985190R. ISSN: 0022-3042.

AU Kilty I C; Barraclough R; Schmidt G; Rudland P S

AB A thermosensitive mutation of simian virus 40 large T antigen (LTA) gene, the tsA58 gene, was cloned downstream of the 6-kbp **neurofilament** light chain promoter in pPOLYIII and injected into the pronucleus of fertilised oocytes of Sprague-Dawley rats to develop a strain harbouring six copies of the transgene. Immunocytochemical staining of hemizygous

adult tissues with antibodies to the C-terminus of LTA showed that the inactive form of LTA was expressed only in the fibres of the internal capsule and in the choroid plexus of the brain. Culturing the former region at 33 degrees C, the permissive temperature for LTA, yielded a cell line, NF2C, which produced active LTA and grew at 33 degrees C but which produced only inactive LTA and eventually died at the non-permissive temperature of 39 degrees C. This clonal cell line was heterogeneous at 33 degrees C, producing the precursor neuronal cell marker nestin and the glial-specific markers glial fibrillary acidic protein, vimentin and S100A1, as well as weakly producing the neuronal cell markers 68-kDa **neurofilament** protein (NF68) and microtubule-associated protein 2 (MAP2) in different subpopulations of cells. However, at 39 degrees C, the cells produced dendritic, neuronal-like processes and elevated levels of NF68 and MAP2, as well as the neuronal markers synaptophysin, neurone-specific enolase, and low levels of tau, all determined by western blotting and immunofluorescent staining. Basic fibroblast growth factor enhanced the growth of the cells at 33 degrees C but also enhanced the formation of dendritic neuronal-like processes at 39 degrees C. It is suggested that NF2C represents a potential stem cell line from adult brain that expresses precursor and glial cell markers at 33 degrees C but undergoes partial differentiation to a neuronal cell phenotype at 39 degrees C.

 TI Production of **transgenic rats** and mice by the

testis-mediated gene transfer.
 SO J. Reprod. Dev. (1999), 45(1), 29-36
 CODEN: JREDEF; ISSN: 0916-8818
 AU Chang, Kyu-Tae; Ikeda, Akihiro; Hayashi, Katsuhiko; Furuhashi, Yasufumi;
 Nishihara, Masugi; Ohta, Akihiko; Ogawa, Shyoso; Takahashi, Michio
 AB Recent reports have shown that sperm cells incubated with foreign DNA in
 vitro are able to transfer the DNA into eggs at fertilization. The
 present study examd. if an injection of DNA into the testis in vivo could
 generate transgenic animals via sperm ejaculated. We prepd. 3 gene
 constructs; human growth hormone (hGH), hGH receptor (hGHR) and mouse
 leptin (mOB) genes fused to the promoter regions of the mouse genes for
 whey acidic protein (WAP), metallothionein-I (MT) and mouse mammary tumor
 virus (MMTV), resp. Each gene construct mixed with cationic
 liposome was injected into bilateral testes of male rats or mice, and the
 males mated with females 3 or 4 days later. A female rat mated with a
 male treated with MT/hGHR gene gave birth to 17 pups, 3 of which were
 found to carry the transgene. The expression of hGHR mRNA was
 demonstrated in the liver, kidney, muscle and brain after treating with
 zinc in drinking water. At present, the transmission of the exogenous
 gene to the descendants was confirmed up to the F4 generation. Three
 female rats mated with 3 different males injected with MMTV/mOB
 fusion gene produced 10, 14 and 12 pups, resp. The genome of 2 out of
 these 36 pups harbored MMTV-mOB gene, though expression of mOB
 mRNA was not detected. Two female mice were mated with 2 male mice
 injected with WAP/hGH gene and produced 15 and 16 pups, 3 of which
 incorporated the gene. The expression of hGH mRNA in the mammary gland in
 these mice was confirmed. These results indicate that exogenous DNA
 injected into the testis as a liposome-complex can be transferred into
 eggs via sperm and expressed in the postpartum progeny.

 (1); Reeben, M. (1)
 AB Defects in a cysteine proteinase inhibitor of cathepsins, cystatin B
 (CSTB) gene are responsible for progressive myoclonus epilepsy of
 Unverricht-Lundborg type (EPM1)-an autosomal recessive neurodegenerative
 disease. The mechanisms how lack of CSTB causes the disease phenotype are
 still poorly understood. CSTB-deficient mice (Pennacchio et al., Nature
 Genetics, 20, 251-8, 1998) the mouse model of EPM1 provided evidence that
 CSTB could have a role in preventing neuronal apoptosis. We have produced
transgenic rats that overexpress CSTB in the nervous
 system under the control of the rat light **neurofilament** gene
 regulatory regions and demonstrated that cerebellar granule cells from
transgenic rats were more sensitive to the neurotoxic
 effects of glutamate and colchicine as compared with wild-type
 littermates. When these rats were exposed to transient focal cerebral
 ischemia by occluding the middle cerebral artery for 120 min,
transgenic rats showed a trend towards a more severe
 cortical damage measured on day 22 after ischemia and a more severe
 impairment in sensorimotor functions as assessed by the limb-placing test.
 These results are contradictory to our hypothesis of a neuroprotective
 role of CSTB. An explanation for these results could be that a disbalance
 between protease inhibition (CSTB) and proteases (cathepsins) due to CSTB
 overexpression is also harmful. Currently, we are studying metabolites in

09173821

serum and CSF of EPM1 patients and in tissues of knockout mice.
